

## ABSTRACT

3 A nozzle for delivering a measured quantity of viscous liquid including a flared  
4 opening defined by a horizontal perimeter and a flare wall extending inward from the  
5 perimeter, a cylindrically-shaped barrel wall extending from the flare wall downward  
6 to a break point defined by a circle parallel to the flare opening and spaced-apart  
7 therefrom, a cone-shaped wall extending downward from the circular break point and  
8 inward therefrom to a circular exit opening, and a small-diameter exit tube extending  
9 from the circular exit opening to a circular exit aperture.
